

Agricultural Equipment Rental Marketplace for Farmers

Problem Statement

Many farmers cannot afford to purchase costly agricultural equipment such as tractors, harvesters, seed drills, and sprayers. These machines are often required only during specific farming seasons, making ownership expensive and inefficient. At the same time, equipment owners may have machinery that remains idle when it is not in use.

To solve this problem, this project proposes a full-stack web application where farmers and equipment owners can interact through a single online platform. Farmers can register, log in, browse available equipment, book rentals, and manage their bookings. Equipment owners can list their equipment, update availability, approve or reject booking requests, and monitor rentals. The application uses a database to securely store user, equipment, and booking information and is deployed on the cloud so it can be accessed from anywhere.
